

HEKTOR

# Never miss another customer

An AI agent in the chat window on [hektormobil.se/kontakta-oss](https://hektormobil.se/kontakta-oss)

Answers instantly, knows your services, hands over to your staff when it should.

ARCHITECTURE & ROLLOUT PROPOSAL · MANAGEMENT BRIEFING · 2026

# Today: one door, and it is often shut

## How customers reach you today

- The kontakta-oss form: *"Fyll i formuläret så kontaktar vi dig under dagen"*
- support@hektormobil.se
- 070-100 01 00

## When you are open

|                 |               |
|-----------------|---------------|
| Måndag – Fredag | 08:00 – 17:00 |
| Lunchstängt     | 12:00 – 13:00 |
| Lördag – Söndag | Stängt        |

That is 45 of 168 hours a week.

A customer whose mobile stopped working on Friday evening waits until Monday morning. And the question they wanted to ask is probably one you already answer on the site.

# The idea

A chat window on [/kontakta-oss](#).

An AI agent answers instantly from **Hektor's own material** — the site, the FAQ, the terms, your service catalogue — and from **your CRM** when the customer is identified.

The moment it is unsure, or the customer asks for a person, **a human takes over in the same window** — with the whole conversation already in front of them.

# What it looks like

## The customer sees

- an answer in seconds, with the source it came from
- a cited price instead of a guess
- one visible "Prata med en människa" button
- no form to fill in for a question they already have

## Your staff see

- the full transcript, not a bare form submission
- the identified customer, the invoices, and what the AI already tried
- only the conversations the AI could not finish
- a queue that no longer waits for Monday morning

## Hektor keeps

- the phone line, the form and the email address exactly as they are

# Three conversations, one window

## 1 · EXISTING CUSTOMER

*"Why is my first invoice higher than the plan price?"*

AI answers from the published FAQ — pro-rata month plus the 299 kr start fee — and cites it. **No human needed.**

## 2 · NEW CUSTOMER

*"I need mobile broadband for a summer house — what do you have?"*

AI qualifies the need and coverage, answers from the service catalogue, then offers a call or a handover to sales. **A warmer lead than a form row.**

## 3 · NEEDS A PERSON

*"I want to cancel and dispute last month's charge."*

AI does not argue and does not decide. It confirms the request, checks opening hours, and transfers to support with the transcript. **A handover, not a dead end.**

# Architecture, from 10,000 metres

1 · CUSTOMER

Chat widget on /kontakta-oss — one script tag, inherits the site's look, works on mobile

2 · GATEWAY

Session, identity, consent, rate limiting, audit log

3 · AGENT

**Orchestrator**

tools, guardrails, escalation rules

**Knowledge base**

site, FAQ, terms, catalogue (RAG)

**CRM connector**

read-only, customer-scoped

4 · PEOPLE

Support & sales live-chat inbox — a human takes over in the same window

Every component is separately replaceable. No part of it requires changing how Hektor works today.

# One question, end to end

- 1 Customer types into the widget on /kontakta-oss
- 2 Gateway starts a session, loads consent and any known identity, logs the turn
- 3 Orchestrator classifies the intent and decides which tools it may use
- 4a Knowledge base retrieves the passages that support an answer — from Hektor's own documents
- 4b CRM connector adds customer-scoped facts — only after identification and consent
- 5 Answer is composed with its sources; low confidence or a sensitive intent routes to a human instead
- 6 Everything is logged — question, sources, answer, confidence, handover — for quality and audit

# Where the AI's knowledge comes from

## Public knowledge — no personal data

- hektormobil.se: plans, coverage, the Tele2 network, 5G, VoLTE, WiFi calling
- the FAQ on /kontakta-oss: first invoice, network, VoLTE, WiFi calling, feedback
- Allmänna villkor, cookie and privacy policies, the withdrawal form
- support hours and the escalation rules themselves

## Customer knowledge — only for the identified customer

- subscription and plan, binding period, monthly cost
- invoice and payment status, first-invoice start fees
- open support errands and earlier contacts
- nothing outside the record of the customer in the conversation

The public layer alone answers a large share of what arrives in the inbox today. The CRM layer is what makes an answer *about them* instead of *about the product*.

# A real example

Why is my first invoice higher than the plan price?

Your first invoice covers the period from activation to the end of the month, plus a one-time start fee of 299 kr (299 kr excl. VAT for business) unless something else was agreed.

*Källa: FAQ — "Varför är min första faktura högre som ny kund?" · Allmänna villkor*

Can you split it into two payments?

That is a payment arrangement, so I will not decide it. I can pass you to a colleague who can look at your specific invoices.

*Handing over · transcript attached · Mon–Fri 08:00–17:00*

# The trust layer

Answers carry sources. Every factual claim points at a document in the knowledge base. No source, no answer.

Rules beat the model. Prices, terms, legal text and campaign conditions are read from Hektor's data, never generated from memory.

Confidence decides. Below a threshold, or on a sensitive intent, the AI stops and escalates instead of guessing.

Nothing irreversible without a person. No cancellations, no binding changes, no commitments, no payments.

It never invents a colleague. Handover happens only when a human path is actually open — otherwise it takes a message and says when you will reply.

# Data protection is a design constraint, not a slide

## Built in from day one

- GDPR: Hektor remains controller; a processing agreement covers the supplier
- lawful basis recorded per purpose; the privacy policy is updated for chat
- the AI sees only the record of the customer it is talking to
- personal data is masked before it reaches the model where it is not needed

## Controlled and provable

- identity is established before any account detail is shown
- transcripts and decisions are logged for audit and dispute handling
- retention and deletion rules are set by Hektor, not by the vendor
- sales conversations are routed as marketing, service conversations as support

Identity is the gate: no customer number or verified phone number, no CRM data — regardless of what the customer claims in the chat.

# When a human has to take over

## The customer asks for a person

One button, always visible. No "are you sure" loop and no attempt to talk them out of it.

## The AI escalates on its own

Low confidence, a sensitive intent, an angry customer, or a question outside the knowledge base.

## The human arrives prepared

Transcript, identified customer, CRM record, what the AI already tried and where it stopped.

### Within opening hours

Live handover in the same window; the customer keeps typing in one place.

### Outside opening hours

The AI takes the details, confirms what happens next, and files the errand with the transcript for Monday morning.

# Rollout in three phases

## PHASE 1 · WEEKS 1–4

### Answer from published material

- chat widget live on /kontakta-oss
- knowledge base from site, FAQ, terms, catalogue
- no personal data and no CRM access
- handover files a support errand

---

Gate: answer quality reviewed by your support team

## PHASE 2 · WEEKS 5–10

### Know the customer

- identity check, then customer-scoped CRM reads
- invoice, subscription and errand status answers
- full audit log and retention rules
- staff can see and correct every answer

---

Gate: legal sign-off and a measured accuracy baseline

## PHASE 3 · WEEKS 11+

### Run the queue

- skill-based routing to support and sales
- out-of-hours capture with clear response promises
- proactive follow-up on open errands
- continuous tuning from real transcripts

---

Gate: measurable deflection and satisfaction targets

# How we will know it works

$\geq 40\%$

of chat conversations resolved  
without a human (Phase 1 target)

$< 10\text{ s}$

first response, day and night,  
including weekends

24/7

coverage of the first question —  
up from 45 hours a week

0

incorrect price or term statements  
in the weekly audit sample

**How it is measured:** a pilot on a share of traffic with a control group, reviewed weekly against the same tickets your support team handles today. Deflection, first-response time, satisfaction after handover, and the share of after-hours conversations that would otherwise have waited until Monday.

*These are targets to be agreed with you, not promises — a four-week pilot exists precisely to replace them with your numbers.*

# What this asks of Hektor

## 1 Access to the knowledge

the documents you already publish, plus a named owner inside Hektor who approves changes to what the AI may say.

## 2 Read-only CRM access

an API, a scheduled export, or a scoped integration user — whatever your CRM supports. Read-only, customer-scoped, audited.

## 3 A pilot window and a control group

so results are measured against your real traffic instead of our estimates.

## 4 Two people, part-time

one from support for answer quality, one from management for decisions. No new headcount.

Nothing above requires changing the website's design, the phone line, the email address, or the existing form. The chat is an additional way in.

# The three objections

## **"We are too small for this."**

Small teams feel the 123 closed hours the most. Phase 1 is one script tag and a knowledge base — no CRM and no new systems.

## **"It will make up prices."**

It reads prices and terms from your data and cites them; anything binding is refused and handed to a person. The weekly audit samples answers against their sources.

## **"We already have support."**

Support keeps every conversation that needs judgement. The AI takes the ones that need a lookup — and hands over with the transcript already written.

# Next step: a four-week pilot

## Weeks 1–2

Build the knowledge base from your published material and stand the widget up on /kontakta-oss.

## Weeks 3–4

Run it on a share of traffic, with your support team reviewing answers daily.

## Day 28

A one-page result: what it answered, what it escalated, what it got wrong, and what Phase 2 would cost.

What we need to start: a **yes to the pilot**, access to the published material, and one contact person at Hektor.

# Appendix: how this deck was made

Built with Slidev, driven by an MCP server

- the deck is plain markdown — versionable, reviewable, diffable
- an MCP client inside the agent harness rendered, hosted and exported it
- every slide was screenshot-reviewed before being called done

Tools used

`render_slides` · `export_slides` · `screenshot_slides`

`list_session_slides` · `list_themes` · `browse_themes`

`get_theme` · `get_slidev_guide`

The same pattern — retrieve, answer, cite, escalate — is what would run inside the chat window on your own site.
