

HEKTOR

# Never miss another customer

An AI agent in the chat window on [hektormobil.se/kontakta-oss](https://hektormobil.se/kontakta-oss)

Answers in seconds, knows your services, hands over to your staff when it should.

ARCHITECTURE AND PILOT PROPOSAL · MANAGEMENT BRIEFING

# Today: one door, and it is often shut

## How customers reach you

- The kontakta-oss form: *"Fyll i formuläret så kontaktar vi dig under dagen"*
- support@hektormobil.se (e-post)
- 070-100 01 00

## When you are open

|                 |               |
|-----------------|---------------|
| Måndag - Fredag | 08:00 - 17:00 |
| Lunchstängt     | 12:00 - 13:00 |
| Lördag - Söndag | Stängt        |

That is 45 hours out of 168.

Someone whose mobile stopped working on Friday evening waits until Monday morning. The question they wanted to ask is probably one you already answer on the site.

# The idea

A chat window on [/kontakta-oss](#).

An AI agent answers right away from **Hektor's own material**: the website, the FAQ, the terms and your service catalogue. When the customer is identified it can also read **their record in your CRM**.

If it is unsure, or the customer asks for a person, **a human takes over in the same window**, with the whole conversation already in front of them.

# What it looks like

**H Hektor Support**  
• AI-assistent - svarar direkt

Hej! Jag är Hektors AI-assistent. Jag kan svara på frågor om abonnemang, fakturor, tackning och våra tjänster, dygnet runt. Vad kan jag hjälpa dig med?

Varför är min första faktura högre än abonnemangspriset?

Din första faktura täcker perioden från aktiveringen till slutet av månaden, plus en engångsavgift på **299 kr inkl. moms** (299 kr exkl. moms för företag) om inget annat avtalats. Därför blir den högre än månadspriset.

Källa: **Vanliga frågor**, "Varför är min första faktura högre som ny kund?" - Hektors allmänna villkor

Kan ni dela upp den på två betalningar?

Det är en betalningsuppställning, så den vill jag inte avgöra själv. Jag kopplar dig till en kollega som tittar på just dina fakturor. Jag skickar med hela konversationen så du slipper upprepa dig.

**Vidarekopplad till en kollega**  
Kundnummer **104287**  
Ärende: dela upp första fakturan  
Hela konversationen följer med

AI-assistent - Prototyp för demo - Inga riktiga kunduppgifter

Skriv ett meddelande...

**Prata med en människa**

Customer types a question. The answer is backed by a source, and the price comes from Hektor's own documents rather than from the model's memory.

When the question turns into a payment arrangement, the AI declines to decide. It hands over, and the transcript follows.

## What the customer gets

- an answer in seconds, with the source it came from
- one visible "Prata med en människa" button

## What your staff get

- the full transcript, not a bare form submission
- the identified customer and what the AI already tried

A mockup with invented customer data, not a screenshot of a finished product. The phone line, the form and the email address stay as they are.

# Three conversations, one window

## 1 · EXISTING CUSTOMER

*"Why is my first invoice higher than the plan price?"*

The AI answers from the published FAQ, pro-rata month plus the 299 kr start fee, and cites the page. **No human needed.**

## 2 · NEW CUSTOMER

*"I need mobile broadband for a summer house. What do you have?"*

It asks about coverage and usage, answers from the service catalogue and offers to put them through to sales. **A warmer lead than a form row.**

## 3 · NEEDS A PERSON

*"I want to cancel and dispute last month's charge."*

It does not argue and does not decide. It confirms the request, checks opening hours and passes the case to support with the transcript. **A handover, not a dead end.**

# Architecture, from 10,000 metres

1 · CUSTOMER

Chat widget on /kontakta-oss. One script tag, inherits the look of the site, works on mobile

2 · GATEWAY

Session, identity, consent, rate limiting, audit log

3 · AGENT

**Orchestrator**

tools, guardrails, escalation rules

**Knowledge base**

site, FAQ, terms, catalogue (RAG)

**Model API**

your provider, your key

4 · PEOPLE

Support and sales live-chat inbox. A human takes over in the same window

Every part can be replaced on its own. None of it requires changing how Hektor works today.

# One question, end to end

- 1 Customer types into the widget on /kontakta-oss
- 2 Gateway starts a session, loads consent and any known identity, logs the turn
- 3 Orchestrator works out what is being asked and which tools it is allowed to use
- 4a Knowledge base fetches the passages that back up an answer, from Hektor's own documents
- 4b CRM connector adds facts about this customer, and only after identification and consent
- 5 Answer is put together with its sources. Low confidence, or a sensitive question, goes to a human instead
- 6 Everything is logged: question, sources, answer, confidence, handover

# Where the answers come from

## Public information, no personal data

- hektormobil.se: plans, coverage, the Tele2 network, 5G, VoLTE, WiFi calling
- the FAQ on /kontakta-oss: first invoice, network, VoLTE, WiFi calling, feedback
- Allmänna villkor, the cookie and privacy policies, the withdrawal form
- support hours and the escalation rules themselves

## Customer information, only for the customer in the chat

- subscription and plan, binding period, monthly cost
- invoice and payment status, first-invoice start fees
- open support errands and earlier contacts
- nothing outside the record of the customer in the conversation

The left column alone answers a big share of what lands in the inbox today. The right column is what makes an answer about *them* instead of about *the product*.

# How the AI is powered

The model is a service we call, the same way you would call any other API. You choose who provides it.

## Your choice, your account

- You buy the API key. OpenAI, Anthropic, Google, Mistral, or an EU-hosted provider
- Hektor's own account with that provider, billed directly by them. We add nothing on top
- The key stays in a secret store on your side and can be rotated or revoked at any time
- If you are not happy with the models, we change provider without touching the rest of the system

## What we set up and run

- the agent, the knowledge base and the guardrails around them
- model and cost controls: which model answers what, and a monthly token ceiling
- a fallback provider, so one outage does not take the chat down
- the quality review loop, so a model swap is measured before it goes live

No lock-in at either end. The provider can be swapped, and the agent can be switched off, without rebuilding anything else.

# Keeping it on the rails

Every claim points at a document. If there is no source in the knowledge base, there is no answer.

Rules beat the model. Prices, terms, legal text and campaign conditions are read from Hektor's data, never written from memory.

Unsure means stop. Below a confidence threshold, or on a sensitive question, it escalates instead of guessing.

Nothing irreversible. No cancellations, no binding changes, no commitments, no payments without a person.

It does not promise a colleague who is not there. Handover happens only when someone is actually available. Otherwise it takes the details and says when you will get back.

# Data protection and identity

## Built in from the start

- Hektor stays the data controller, the supplier is the processor under a data processing agreement
- a lawful basis is recorded for each purpose, and the privacy policy is updated for chat
- the AI sees only the record of the customer it is talking to
- personal data is masked before it reaches the model where it is not needed

## Controlled and provable

- identity is established before any account detail is shown
- transcripts and decisions are kept for audit and dispute handling
- retention and deletion rules are set by Hektor, not by us
- sales conversations are handled as marketing, service conversations as support

Identity is the gate. No customer number or verified phone number means no CRM data, whatever the customer claims in the chat.

# When a human takes over

## The customer asks for a person

One button, always visible. No "are you sure" loop and no attempt to talk them out of it.

## The AI escalates on its own

Low confidence, a sensitive question, an angry customer, or something the knowledge base does not cover.

## The human arrives prepared

Transcript, identified customer, CRM record, what the AI already tried and where it stopped.

### During opening hours

Live handover in the same window. The customer keeps typing in one place.

### Outside opening hours

The AI takes the details, says what happens next, and files the errand with the transcript for the morning.

# What we need from Hektor

## 1 The material the AI may use

the documents you already publish, plus one named person at Hektor who approves changes to what the AI is allowed to say.

## 2 Read-only CRM access

an API, a scheduled export, or a scoped integration user, whichever your CRM supports. Read-only, limited to the customer in the chat, fully logged.

## 3 A model provider

the API key and the account. You pick the provider and you hold the contract.

## 4 Two people, part-time

one from support for answer quality, one from management for decisions. No new headcount.

Nothing here means changing the website's design, the phone line, the email address or the existing form. The chat is one more way in.

# How we will know it works

$\geq 40\%$

of chat conversations finished  
without a human

$< 10\text{ s}$

to a first answer, at any hour,  
including weekends

24/7

something answers the first  
question, up from 45 hours a week

0

wrong prices or terms in the  
weekly audit sample

**How it is measured:** a pilot on a share of your traffic, reviewed every week against the same tickets support handles today. Deflection, first-response time, satisfaction after a handover, and how many after-hours conversations would otherwise have waited until Monday.

*These are targets for us to agree with you, not promises. The pilot exists to replace them with your numbers.*

# The three objections

## **"We are too small for this."**

A small team feels those 123 closed hours the most. The first version is a chat widget and a knowledge base. No CRM, no new systems.

## **"It will make up prices."**

It reads prices and terms from your data and cites where they came from. Anything binding it refuses and hands over. The weekly audit checks answers against their sources.

## **"We already have support."**

Support keeps every conversation that needs judgement. The AI takes the ones that need a lookup, and hands over with the transcript already written.

# Next step: a measured pilot

## Start with answers

Build the knowledge base from your published material, put the widget on /kontakta-oss, and let your support team judge the answers.

## Then add the customer

Turn on identity and read-only CRM lookups once the answers are good enough and legal has signed off.

## Then look at the numbers

One page: what it answered, what it escalated, what it got wrong, and what the next step would cost.

What we need to start: a yes to the pilot, the published material, and one contact person at Hektor.
