

HEKTOR

Never miss another customer

The Hektor Agent in the chat window on hektormobil.se/kontakta-oss

Answers in seconds, knows your services, hands over to your staff when it should.

HOW IT WORKS, AND WHAT A PILOT WOULD LOOK LIKE · MANAGEMENT BRIEFING

Today: one door, and it is often shut

How customers reach you

- The kontakta-oss form: *"Fyll i formuläret så kontaktar vi dig under dagen"*
- support@hektormobil.se (e-post)
- 070-100 01 00

When you are open

Måndag - Fredag	08:00 - 17:00
Lunchstängt	12:00 - 13:00
Lördag - Söndag	Stängt

That is 45 hours out of 168.

Someone whose mobile stopped working on Friday evening waits until Monday morning. The question they wanted to ask is probably one you already answer on the site.

The idea

A chat window on [/kontakta-oss](#).

The [Hektor Agent](#) answers right away from [Hektor's own material](#): the website, the FAQ, the terms and your service catalogue. When the customer is identified it can also read [their record in your CRM](#).

If it is unsure, or the customer asks for a person, [a human takes over in the same window](#), with the whole conversation already in front of them.

What it looks like

The customer asks a question. The Hektor Agent answers with the price taken from Hektor's own documents, and shows which page it came from.

The next question is about splitting a payment. That is a commercial decision, so it hands the conversation to a colleague, and passes the conversation along.

What the customer gets

- an answer in seconds, with the page it came from
- one visible "Prata med en människa" button

What your staff get

- the full conversation, not a bare form submission
- the customer's details, and what was already tried

A mockup with invented customer data, not a screenshot of a finished product. The phone line, the form and the email address stay as they are.

Three conversations, one window

1 · EXISTING CUSTOMER

"Why is my first invoice higher than the plan price?"

The Hektor Agent answers from the published FAQ, the part-month plus the 299 kr start fee, and shows the page. **No one had to be involved.**

2 · NEW CUSTOMER

"I need mobile broadband for a summer house. What do you have?"

It asks where the summer house is and how the connection will be used, answers from the service catalogue, and offers to pass them to sales. **A warmer lead than a form row.**

3 · NEEDS A PERSON

"I want to cancel and dispute last month's charge."

It does not argue and does not decide. It confirms the request, checks the opening hours, and passes the case to support with the conversation attached. **A handover, not a dead end.**

How it fits together

THE CUSTOMER

Opens the chat on /kontakta-oss. Nothing to install, nothing new to learn, works on a phone

THE FRONT DESK

Greets the customer, checks who they are and what they have agreed to, and keeps a record of everything that is said

THE HEKTOR AGENT

Works out the question
and whether it is allowed to help

Reads your own material
the site, the FAQ, the terms, the
catalogue

Looks up the customer
only once they are identified

YOUR PEOPLE

Support and sales pick up the conversations the Hektor Agent could not finish, in the same window

Each of these four pieces can be changed on its own. None of it means changing how Hektor works today.

What happens when someone asks a question

- 1 The customer types their question in the chat on /kontakta-oss
- 2 The chat notes what the customer has agreed to, checks whether they are already known, and starts a record
- 3 The Hektor Agent works out what is being asked, and what it is allowed to do about it
- 4a It finds the passages in Hektor's own documents that answer the question
- 4b If the customer is identified, it adds **their own details** from your customer records
- 5 It writes the answer and shows where it came from. If it is not sure, or the question is one only a person should answer, a colleague is brought in instead
- 6 The whole exchange is saved: the question, the pages used, the answer, and whether anyone had to step in

Where the answers come from

What everyone can see, no personal details

- hektormobil.se: plans, coverage, the Tele2 network, 5G, VoLTE, WiFi calling
- the FAQ on /kontakta-oss: first invoice, network, VoLTE, WiFi calling, feedback
- Allmänna villkor, the cookie and privacy policies, the withdrawal form
- the opening hours and the handover rules themselves

What only the customer in the chat can see

- their subscription and plan, binding period, monthly cost
- invoice and payment status, first-invoice start fees
- open support errands and earlier contacts
- nothing outside the record of the customer in the conversation

The left column alone answers a big share of what lands in the inbox today. The right column is what makes an answer about *them* instead of about *the product*.

How the Hektor Agent is powered

Writing the answers takes a language model, in the same way a website takes a web host. You choose who supplies it, and you hold the account.

Your choice, your account

- You open the account: OpenAI, Anthropic, Google, Mistral, or a supplier inside the EU
- Hektor pays that supplier directly, at their list price. We add nothing on top
- The access key sits with you, and you can replace or cancel it whenever you want
- If you are not happy with the answers, we move to another supplier without touching anything else

What we set up and look after

- the Hektor Agent, the material it reads, and the rules it follows
- day-to-day running, plus a monthly spending ceiling you set
- a second supplier on standby, so one supplier's bad day does not close your chat
- the quality checks, so any change is measured before it goes live

You are not tied to anyone. The supplier can be changed, and the chat can be switched off, without rebuilding the rest.

Keeping it on the rails

Every claim points at a document. If it is not in Hektor's material, the Hektor Agent does not answer. It says so, and offers a colleague.

Prices come from your list, not from the machine. Prices, terms, legal text and campaign conditions are read from Hektor's data. They are never invented.

Unsure means stop. If it is not confident, or the question is about money or a contract, it asks a colleague instead of guessing.

Nothing is final without a person. No cancellations, no changes to an agreement, no promises, no payments.

It never promises a colleague who is not there. A handover only happens while someone is on duty. Otherwise it takes the details and tells the customer when you will get back.

Data protection and identity

Built in from the start

- Hektor remains responsible for the data. The supplier works under a written agreement
- we record why each piece of data is used, and the privacy policy is updated for chat
- the Hektor Agent sees only the customer it is talking to, and nothing else
- personal details the answer does not need are hidden before the question is sent on

Controlled, and provable afterwards

- we confirm who the customer is before showing anything about their account
- conversations and decisions are kept, so a dispute can be settled
- how long records are kept, and when they are deleted, is Hektor's decision
- sales conversations are treated as marketing, service conversations as support

Identity is the gate. No customer number or verified phone number means no customer records, whatever the person in the chat claims.

When a human takes over

Outside opening hours the same thing happens: the Hektor Agent takes the details, tells the customer when you will get back, and leaves the conversation with the errand.

What we need from Hektor

1 The material the Hektor Agent may use

the documents you already publish, plus one named person at Hektor who approves changes to what it is allowed to say.

2 Read-only access to customer records

whichever way your system allows. It can look, never change. One customer at a time, and every lookup is recorded.

3 A language model account

you pick the supplier and hold the contract. We tell you what to open and how to limit the spending.

4 Two people, part-time

one from support to judge the answers, one from management to make decisions. No new staff.

Nothing here means changing the website's design, the phone line, the email address or the existing form. The chat is one more way in.

How we will know it works

$\geq 40\%$

of chats finished without anyone
from support

$< 10\text{ s}$

to a first answer, at any hour,
including weekends

24/7

something answers the first
question, up from 45 hours a week

0

wrong prices or terms in the
answers we check each week

How we check: the chat runs for a share of your visitors, and every week we compare it with the tickets support handles today. How many questions it finished on its own, how quickly it answered, how people felt about the handover, and how many evening and weekend questions would otherwise have waited until Monday.

These are targets for us to agree with you, not promises. The pilot is there to replace them with your numbers.

The three objections

"We are too small for this."

A small team feels those 123 closed hours the most. The first version is a chat window and your published documents. No new systems, and no access to customer records yet.

"It will make up prices."

It reads prices and terms from your own list and shows where each one came from. Anything binding it refuses and passes to a person. We check a sample of answers every week against their source.

"We already have support."

Support keeps every conversation that needs judgement. The Hektor Agent takes the ones that are simply a lookup, and passes them on with the conversation already written down.

Next step: a measured pilot

Start with answers

Load your published material, put the chat on /kontakta-oss, and let your support team judge the answers for themselves.

Then add the customer

Turn on identity checks and customer lookups once the answers are good enough, and once legal has signed off.

Then look at the numbers

One page: what it answered, what it passed on, what it got wrong, and what the next step would cost.

What we need to start: a **yes to the pilot**, the material you publish, and one contact person at Hektor.
